JIANG NAN 江南	**Pest Control Policy**	Document No.:	IKQAP#006
		Revision No.	2
	Imperial Kitchen Group Inc.,	Effective Date:	June 28, 2026

1. Policy Statement

Imperial Kitchen Group Inc., enforces a zero-tolerance policy regarding the presence of pests (rodents, insects, birds, and other vermins) within the facility and store. The company recognizes that pests are major vectors of foodborne pathogens (Salmonella, Leptospirosis, E. Coli). Our approach focuses on exclusion, restriction, and destruction to ensure a safe and sanitary environment for food preparation and service.

2. Scope

This policy applies to the entire premise, including the internal areas (kitchen, stock rooms, dining area, restrooms, and offices) and external; areas (loading docks, waste disposal areas, perimeter grounds, and delivery vehicles).

3. Responsibilities

3.1. Facilities Maintenance

Shall be responsible for facility maintenance and day-to-day operations must ensure strict adherence to physical exclusion and structural integrity guidelines. This includes maintaining self-closing external doors fitted with tight door sweeps that block out all visible light underneath, as well as keeping all openable windows and vents equipped with intact fly screens. Employees must ensure that air curtains at delivery entrances are fully functional and turned on during all deliveries. Furthermore, any structural gaps or openings around pipes, drains, and electrical conduits must be proactively sealed with silicone or concrete to eliminate potential rodent entry points.

3.2. Quality Assurance (QA)

Shall be responsible for overseeing remediation, legal compliance, and long-term prevention. They must prioritize the categorical disposal of compromised inventory and ensure the deep-cleaning of all contact surfaces using FDA-approved sanitizers.The Quality Assurance department must perform a structural audit to eliminate organic accumulation and structural gaps, thereby restoring the "vermin-proof" integrity required by their sanitary permit.

3.3. Third-Party Licensed Pest Control Operator (PCO)

Shall be held sole responsibility for all chemical destruction and specialized pest interventions. The PCO is responsible for conducting a comprehensive monthly inspection and executing necessary pest control activities. For internal areas, the PCO is permitted to utilize mechanical traps (such as glue boards and snap traps) and UV fly zappers, while ensuring toxic bait is completely kept out of food areas. For external areas, the PCO must anchor tamper-resistant bait solutions along the perimeter. Following each visit, the PCO must provide a comprehensive service report detailing activity levels and the specific chemicals utilized.

4. Integrated Pest Management

4.1. Exclusion

- **Physical Barriers:** All external doors must be self-closing and fitted with tight door sweeps. No light should be visible underneath.
- **Screens:** All openable windows and vents must be fitted with intact fly screens.
- **Air Curtains:** Air curtains at delivery entrances must be functional and turned ON during all deliveries
- **Structural Integrity:** Gaps around pipes, drains, and electrical conduits must be sealed with silicone or concrete to prevent rodent entry.

4.2. Restriction

- **Sanitation:** Food debris and spills must be cleaned immediately. Overnight clutter is strictly prohibited.
- **Storage:** Food items in dry storage must be kept off the floor, minimum 15cm/ 6 inches) and away from walls to eliminate hiding spots.
- **Waste Management:** Garbage bins must be kept covered at all times. External dumpsters must be located away from the building, kept closed, and washed regularly to prevent grease buildup.

4.3. Destruction

- **Third-Party Contractor:** Pest control procedures involving chemical application must be performed only by a licensed, FDA-accredited pest control operator (PCO).
- **Staff Restriction:** Restaurant employees without PCO certification are strictly prohibited from applying industrial pesticides or domestic sprays (e.g. aerosol fly sprays) in food preparation areas to avoid chemical contamination.
- **Traps & Baits:** Internal baits include mechanical traps (glue boards, snap traps) and UV fly zappers are permitted inside. Toxic bait is prohibited inside food areas. External baits include tamper-resistant bait solutions that must be anchored along the perimeter.

5. Monitoring and Reporting

- Pest Sighting logbook must be maintained on-site. Any employee who spots a pest or signs of pest activity (droppings, gnaw marks, egg casings) must record the date and time, specific location, and type of pest.
- The PCO shall conduct a monthly comprehensive inspection, pest control activity, and provide a service report detailing activity levels and chemical used.

6. Corrective Action

In accordance with the Food Safety Act of 2013 (RA 10611), the confirmation of pest activity necessitates the immediate execution of containment protocols, beginning with the formal suspension of operations within the affected zone. All raw materials, finished products, and packaging potentially exposed to the hazard must be isolated and secured under a strict quarantine status. Under the Code on Sanitation of the Philippines (P.D. 856), these materials are legally deemed adulterated and must be conspicuously labeled as "Not for Human Consumption" to ensure their permanent exclusion from the consumer supply chain.

Remediation efforts must prioritize the categorical disposal of compromised inventory and the deep-cleaning of all contact surfaces using FDA-approved sanitizers. Management is further required to perform a structural audit to eliminate harborages—addressing organic accumulation and structural gaps—to restore the "vermin-proof" integrity mandated by the establishment's sanitary permit. Legal compliance dictates that chemical intervention be restricted exclusively to FDA/DOH-accredited Pest Control Operators (PCOs); the use of unauthorized, over-the-counter pesticides is strictly prohibited as it introduces unmanaged chemical risks into the food preparation and service environment.

To ensure regulatory transparency and long-term prevention, a formal Root Cause Analysis (RCA) must be performed to identify the specific failure in the company and store's Integrated Pest Management (IPM) plan. Every phase of this corrective action—from the initial detection to the final verification by a licensed professional—must be meticulously recorded in the establishment's Pest

Control Log. This auditable trail serves as the primary legal defense during LGU or FDA inspections, as failure to demonstrate robust pest management can result in severe administrative penalties.

7. Documentation

The following records must be kept on file for Health Department/ LGU Audits:

- Contract with the licensed Pest Control Operator
- Safety Data Sheets (SDS) for all chemicals used by the PCO
- Service reports and trend analysis
- Map of bait station locations.

8. Change History

Revision No.:	Revision Date:	Author & Position:	Purpose of Revision
