JIANG NAN 江南	**Receiving Inspection Policy**	Document No.:	IKQAP#009
		Revision No.	1
	Imperial Kitchen Group Inc.,	Effective Date:	June 28, 2026

1. Policy Statement

In strict accordance with the Food Safety Act of 2013 (Republic Act No. 10611) and FDA Philippines regulations, Imperial Kitchen Group Inc. enforces a rigorous Receiving Inspection Policy as the primary defense against the introduction of biological, chemical, and physical hazards into our facility and stores. It is our uncompromising mandate that no raw material, ingredient, or packaging enters our inventory without verified documentary integrity—specifically Certificates of Analysis (COA) and comprehensive "one-step-back" traceability data—paired with a thorough physical inspection for temperature compliance, package integrity, and sanitation. Any shipment exhibiting evidence of pest infestation, thermal abuse, or regulatory non-compliance will be immediately rejected to safeguard the integrity of the food chain. All verification activities are recorded in real-time to maintain a permanent, auditable trail of compliance, making this policy a mandatory directive for all Receiving, Warehouse, and Quality Assurance employees to ensure total consumer protection.

2. Scope

This policy applies to all incoming raw materials, food ingredients, additives, processing aids, and primary or secondary packaging used in the manufacturing and distribution of Imperial Kitchen Group Corp. under Jiangnan Hotpot brand meals. Its jurisdiction encompasses every stage of the material intake process—beginning with the arrival of the transport vehicle at the loading bay and concluding with the final disposition of goods into either inventory or quarantine. The mandates herein are binding for all Quality Assurance (QA), Warehouse, and Supply Chain Management (SCM) employees, as well as any third-party logistics (3PL) providers operating on behalf of the company and brand. Furthermore, this scope extends across all company-operated facilities, including stores and satellite warehouses, ensuring that every component intended for food contact or consumption is verified against the safety requirements of Republic Act No. 10611 and FDA Philippines prior to release.

3. Responsibilities

3.1. Quality Assurance (QA)

Shall be responsible for implementing a systematic random sampling protocol for high-risk raw materials (such as dairy, fruit concentrates, and probiotics) to verify sensory evaluations, organoleptic features, and chemical specifications through analytical pH or Brix testing. Furthermore, QA manages the mandatory QA retention sampling, ensuring that representative aliquots from each batch are securely archived under equivalent storage conditions for the duration of the product's shelf life plus a defined buffer period to serve as a critical reference for future investigations. In the event of a shipment failure, Only QA is authorized to handle, generate, and officially release the Supplier Feedback Report (SFR) for non-compliance. Once issued by QA, Supply Chain Management (SCM) is strictly responsible for the final transmission and subsequent compliance communication with the supplier.

3.2. Receiving Warehouse Employees

Shall be tasked with the critical frontline execution of this policy. Before a delivery vehicle is even opened, they must perform a pre-unloading documentary verification to ensure the presence and validity of mandatory documents, including the FDA License to Operate (LTO), Certificate of Product Registration (CPR), Local Government Unit (LGU) permits, and any applicable third-party certifications. Following successful document review, they are responsible for executing a physical inspection based on non-negotiable parameters, which include assessing the vehicle's condition, verifying supplier audit compliance, checking package integrity, monitoring precise temperature controls, and ensuring compliant product labeling. They are also bound to record all verification activities in real-time to maintain an auditable compliance trail.

3.3. Warehouse & Supply Chain Management (SCM) Employees

Shall be strictly bound by the mandates governing every stage of the material intake process. This responsibility begins the moment a transport vehicle arrives at the loading bay and concludes only when the final disposition of goods is successfully made into either inventory or quarantine. They are required to uphold these standards across all stores and satellite warehouses to safeguard the integrity of the food chain.

3.4. Supply Chain Management (SCM)

Shall be responsible for receiving the Supplier Feedback Report *(IQAF-005)* for Non-Conformance whenever a shipment fails to meet the required criteria. SCM maintains these documentation records to officially track and evaluate overall supplier performance and compliance history. While SCM is not responsible for handling or processing the Supplier Conformance Form (SCF), the SCM shall serve as the exclusive channel of communication with the supplier regarding any non-compliance issues. This ensures that all feedback, dispute resolutions, and corrective action discussions are routed solely through SCM to maintain a unified and professional corporate relationship.

3.5. Third-Party Logistics (3PL) Providers

Third-party logistics providers operating on behalf of the company and the Jiangnan Hotpot brand are legally bound by the jurisdictions and mandates of this policy. Shall be responsible for adhering to the strict transport vehicle and physical inspection criteria, ensuring that their vehicles are clean, odor-free, dedicated solely to food transport, free of pests or physical damage, and never co-shipped with chemicals or hazardous materials.

4. Pre-Unloading Documentary Verification

Before a delivery vehicle is opened, the Receiving/ Warehousing Employee must verify that the following documents are present and valid:

- **FDA License to Operate (LTO):** Mandatory for all local manufacturers, distributors, importers, and repackers of food products.
- **Certificate of Product Registration (CPR):** Required for all pre-packaged and processed food ingredients or additives being supplied.
- **Local Government Unit (LGU) Permits:** Sanitary permits and business registrations as required by local health offices.
- **Third-Party Certifications (If applicable):** Proof of adherence to Good Manufacturing Practices (GMP), Hazard Analysis and Critical Control Points (HACCP), or ISO 22000.

5. Vehicle and Physical Inspection Criteria

Upon successful document review, the physical inspection proceeds based on the following non-negotiable parameters:

- **Vehicle Condition-** The transport vehicle must be clean, free of odors, and dedicated to food transport. No co-shipment with chemicals or hazardous materials.
- **Supplier Audit-** Zero evidence of pests (drippings, larvae, nesting) or physical damage to the vehicle walls/ floors
- **Package Integrity-** Containers must be sealed, un-dented, and free of leaks or moisture damage
- **Temperature Control-** All perishable items must have a maintained temperature of less than 5°C while frozen items must have a maintained temperature of less than -18°C with no signs of thawing or refreezing
- **Labelling-** In accordance with RA 10611, all products must include product name, manufacturer details, ingredients, allergens, and FDA registration numbers in English or Filipino.

6. Sampling and Quality Testing

To ensure the integrity of high-risk raw materials such as dairy, fruit concentrates, and probiotics, the Quality Assurance (QA) team shall implement a systematic random sampling protocol focused on verifying both organoleptic and chemical specifications through comprehensive sensory evaluations and analytical pH or Brix testing. This process is reinforced by a mandatory QA retention sampling, which requires the secure archiving of representative aliquots from each batch under equivalent storage conditions for the entirety of the product's designated shelf life plus a defined buffer period. These retained samples serve as a critical analytical reference for retrospective root cause investigations, allowing the establishment to conduct comparative microbiological and chemical validations should subsequent quality deviations, stability issues, or consumer complaints arise.

7. Disposition of Non-Conforming Materials

If any of the above criteria are not met, the following actions must be taken:

- Immediate Rejection: Any material showing signs of pest infestation, temperature abuse, or lack of traceability is rejected at the bay.
- Hold/Quarantine: If documentation is missing out but the product appears safe, the items are tagged with a red "HOLD" sticker and moved to a designated quarantine area until the supplier provides the necessary documentation.
- Reporting: A Supplier Feedback Report ***(IQAF-005)*** for Non-Conformance is generated and sent to the Purchasing and SCM departments for record-keeping and supplier evaluation.

8. Documentation and Record Keeping

In compliance with FDA audit requirements, all receiving logs must be maintained for at least two years or one year past the product's expiry date (whichever is longer). This includes the Receiving Inspection Log, Temperature Logs, and NCRs.
