JIANG NAN 江南	**Glass and Brittle Plastic Policy**	Document No.:	IKQAP#017
		Revision No.	2
	Imperial Kitchen Group Inc.,	Effective Date:	July 13, 2026

1. Purpose

The purpose of this policy is to establish a rigorous control system to eliminate the risk of physical contamination from glass, ceramic, and brittle plastics within food handling environments at Imperial Kitchen Group Inc. adhering to these standards ensures the health and safety of guests and maintains regulatory compliance by preventing foreign body contamination in food products.

2. Scope

This policy applies to all employees, including full-time, and contractual employees, regardless of their position. It is strictly applicable in all food standard environments, which encompass various operational zones where food safety is paramount. These environments include production and preparation areas, defined as any zone where raw materials are processed or meals are cooked, and storage/warehousing areas containing ingredients, packaging materials, or finished goods. Additionally, the scope extends to service points, which are front-of-house areas where food is plated or handed to the client, as well as off-site events where the company performs official catering or food service duties. This comprehensive coverage ensures the health and safety of both employees and clients by preventing contamination and maintaining regulatory compliance at all times while staff members are performing official duties or representing the company.

3. Responsibilities

3.1. Back of House (BOH) & Front of House (FOH) Employees

Shall strictly adhere to the established safety standards to eliminate physical contamination risks and maintain regulatory compliance. Employees are individually responsible for preventing foreign material risks by ensuring that personal glass items—including drinking vessels, mirrors, or glass perfume and cologne bottles—never enter designated food zones. Employees must also actively participate in required re-training to properly execute the Daily Shift Inspection Checklist, inspecting hard plastics like acrylic dispensers and light covers for cracks before they degrade into physical hazards. In the event of a brittle material failure or glass breakage, employees are responsible for immediately halting all food production in the affected area to stop the mechanical spread of fragments across active lines.

3.2. Sanitation Employees

Shall be responsible for safely executing all remediation and disposal procedures while utilizing proper precautions to protect themselves from lacerations. They must isolate the affected area using dedicated, color-coded cleanup tools rather than standard cleaning gear to eliminate cross-contamination risks. Employees are tasked with carefully collecting all brittle fragments and ensuring they are securely deposited into a designated "sharps" container. Additionally, sanitation employees are responsible for formally condemning and disposing of all food products quarantined within the mandatory 3-meter contamination radius to ensure no compromised items leave the facility.

3.3. Restaurant, Shift and Area Managers

Shall bear the responsibility of conducting objective verification and providing formal operational clearance following a breakage incident. They must thoroughly inspect the remediation zone to ensure the environment is safe for food contact before allowing any operations to back up. The kitchen area is strictly prohibited from restarting until the supervisor provides an official cleanup. Furthermore, they are responsible for maintaining full traceability by investigating and fully documenting the incident, its root cause, and the corrective actions taken within the official Breakage Incident & Cleanup Report (CAR).

3.4. Quality Assurance (QA)

Shall holds a dual set of responsibilities that span both operational safety and policy enforcement. In collaboration with Supply Chain and Operations Management, QA is responsible for maintaining the master Glass and Brittle Plastic register and ensuring that all mandatory operational hardware is meticulously recorded. This collaborative effort also requires them to verify that any replaced essential glass components, such as equipment gauges or windows, are properly fitted with shatterproof covers or safety coatings. Additionally, partnering with Human Resources and Executive Leadership, Quality Assurance is tasked with upholding policy boundaries and enforcing strict disciplinary actions, up to and including suspension without pay, for any continued non-compliance with safety protocols.

3.5. Supply Chain and Operations Management

Shall shares a focused, operational role with the Quality Assurance to mitigate physical hazards on the floor. Together, they are responsible for maintaining the master glass and brittle plastic register and ensuring every piece of mandatory operational hardware is meticulously recorded. Their joint oversight also involves verifying that all replaced essential glass components, including windows and equipment gauges, are securely fitted with safety coatings or shatterproof covers to maintain a compliant environment.

4. Principles

4.1. Material Control and Restrictions

To safeguard food products from physical contamination, processing facilities enforce rigid boundaries regarding what materials can enter processing environments. The presence of uncontrolled glass or fragile components poses a severe risk of introducing sharp, hazardous fragments into the production line, which can lead to consumer injury and devastating product recalls. Recognizing that personal care and convenience items are a primary source of foreign material risk, personal glass items, including drinking vessels, mirrors, or glass perfume/cologne bottles, are strictly prohibited in food zones. However, because certain operations require functional monitoring that alternative materials cannot provide, only essential glass, such as equipment gauges and windows, is permitted within the facility, provided it is meticulously recorded in a master register. To mitigate the inherent vulnerability of this mandatory operational hardware, all essential glass must be shielded with shatterproof covers or safety coatings to prevent fragmentation into food should a failure occur. Finally, because synthetic polymers degrade over time under heavy operational wear and chemical sanitation, hard plastics susceptible to shattering, such as acrylic dispensers and light covers, must be inspected daily for cracks to prevent them from becoming a physical hazard.

4.2. Glass & Brittle Plastic Breakage Protocol

Even with preventative measures, structural failures and accidents involving brittle materials can occur, necessitating an immediate, disciplined containment and remediation strategy to minimize human error, protect employees, and ensure potentially compromised products never leave the facility. The moment a glass or brittle plastic breakage occurs, employees must execute a strict four-step action plan beginning with an immediate shutdown, where all food production in the affected area must cease to stop the mechanical spread of airborne or structural shards across active lines. Next, to account for the unpredictable velocity and trajectory of shattering fragments, the area must be isolated and cordoned off; this includes enforcing a strict three-meter (10-foot) radius quarantine where any food product or packaging material within this zone is treated as contaminated. Following isolation, a segregated cleanup and disposal process must be executed

using dedicated, color-coded tools—such as brooms, dustpans, or vacuums reserved exclusively for brittle material failures—to prevent cross-contamination of standard cleaning gear and protect sanitation personnel from lacerations. All recovered shards and contaminated waste must then be secured in a designated, clearly labeled "Sharps" container. Finally, to eliminate subjectivity and ensure the environment is objectively safe for food contact, a supervisor must thoroughly inspect the area and provide a formal, written sign-off on the cleanup before food production is permitted to resume. It is a critical reminder for all employees to treat all hard, clear, or brittle plastics with the exact same urgency as broken glass and to never mix standard sanitation tools with brittle material cleanup equipment.

5. Corrective Action

Level of Severity	Nature of Non - Conformance	Disciplinary Action
Minor	Internal process failures that may not directly impact product safety but affect overall efficiency and reputation *(e.g fails to fill out the Daily Inspection Checklist)*	**1st Offense:** Incident Report (Written Reprimand) and establishing an official timeline re-training for improvement. **2nd Offense:** A formal corrective action plan is issued by Quality Assurance (QA) **3rd Offense:** Final Warning letter will be given to the employee for continued non-compliance or Suspension without pay (1-2 days) when the employee did not comply after the final warning letter and to QA corrective action.
Major	Deviation from internal or contractual quality standards *(e.g. An employee bringing restricted personal glass items (such as a glass perfume/cologne bottle or personal mirror) into a designated food area.)*	**1st Offense:** Incident Report (Written Reprimand) and establishing an official timeline re-training for improvement. **2nd Offense:** A formal corrective action plan is issued by Quality Assurance (QA) **3rd Offense:** Final Warning letter will be given to the employee for continued non-compliance or Suspension without pay (2-4 days) when the employee did not comply

		after the final warning letter and to QA corrective action.
Critical	Failing to meet regulatory requirements, such as those outlined by the Food Safety Act of 2013 (RA 10611), and Code on Sanitation (PD No. 856) *(e.g. Failing to immediately halt food production in an affected kitchen zone following a glass or brittle plastic breakage)*	**1st Offense:** Immediate Incident Report (Written Reprimand) and formal corrective action plan is issued by Quality Assurance (QA). **2nd Offense:** Final Warning, Suspension without pay (1-5 days).or leading directly to Termination.

6. List of documents

6.1. Corrective Action Report (CAR): Official documentation of any breakage and corrective steps taken.

6.2. Daily Shift Inspection Checklist: Continued non-compliance may lead to disciplinary suspension without pay.
