1. Policy Statement

Imperial Kitchen Group Inc., is committed to delivering safe, high-quality, and legally compliant service through the rigorous application of Good Manufacturing Practices (GMP). This policy serves as the foundational framework for our Food Safety Management System (FSMS), ensuring that all operational processes—from the receiving of raw materials to the final distribution of prepared foods—are conducted within a highly controlled and sanitary environment. The company strictly enforces comprehensive hygiene standards, structural environmental controls, and proactive cross-contamination mitigation strategies to protect the biological, chemical, and physical integrity of our products.

2. Scope

Constitutes a holistic framework that governs every individual, physical environment, and operational procedure critical to maintaining food safety and product integrity. This universal mandate extends beyond direct food handlers and management to include service employees and third-party visitors, ensuring that all human vectors within the facility adhere to standardized hygiene protocols. Geographically, these standards apply to all spatial boundaries throughout the operational lifecycle, from the initial points of receipt and storage through prep, production, and final service areas, as well as peripheral sanitation and utility zones. Operationally, the scope encompasses the rigorous execution of time and temperature controls, the sanitization of both food-contact and non-food-contact surfaces (FCS and NFCS), and the strategic use of environmental controls—such as color-coded tooling and allergen segregation—to effectively mitigate biological, chemical, and physical hazards across the entire flow of food.

3. Responsibilities

3.1. Quality Assurance (QA)

Shall bears the primary responsibility for originating, authoring, and updating the fundamental framework of the Food Safety Management System (FSMS). They define the comprehensive hygiene standards, structural environmental controls,and proactive cross-contamination mitigation strategies required to protect the biological, chemical, and physical integrity of all products. Additionally, QA outlines the operational protocols for the facility, such as establishing the minimum sanitization frequencies for food-contact surfaces, mandating "clean-as-you-go" methodologies, and enforcing the thorough sanitization of reusable plastic containers before they enter the facility's designated "Clean Zone".

3.2. Warehouse Supervisor

Shall bear direct responsibility for the continuous, real-time enforcement of operational process controls within the receiving, storage, and peripheral utility areas. As designated direct supervisors on duty, they are responsible for executing the practical phase of the bifurcated competency assessment by formally observing, verifying, and documenting technical tasks such as proper chemical dilutions and the 6-step handwashing method. They must actively monitor shifts to guarantee absolute compliance with the 20-second handwashing protocol, proper glove rotation, "clean-as-you-go" workflows, and the mandatory restroom "Double Wash" method. Furthermore, they shall oversee and validate the successful completion of sanitation tasks, including the thorough sanitization of reusable plastic containers before they enter the "Clean Zone," to ensure the facility's biological security remains uncompromised.

3.3. Warehouse Employees

Shall be responsible for rigorously executing GMP standards during the receiving and storage of raw materials to protect product integrity from the initial point of delivery. They must strictly enforce environmental controls—such as allergen segregation and the strategic use of color-coded tooling—to effectively mitigate biological, chemical, and physical hazards across all storage zones. Operationally, they are required to maintain a continuous "clean-as-you-go" workflow and ensure the thorough sanitization of reusable plastic containers before they enter the facility's designated "Clean Zone". Furthermore, they must rigorously execute the 20-second, six-step handwashing protocol at critical junctures, utilize the specific restroom "Double Wash" method, properly sanitize their hands before donning gloves, and refrain from wearing any jewelry with the sole exception of a plain wedding band.

3.4. Commissary Supervisor

Shall bear direct responsibility for executing advanced operational process controls within the preparation and production area to safeguard batch integrity and product quality from the initial processing stages. They must strictly implement structural environmental controls, including systematic allergen segregation, raw material traceability, and the rigorous deployment of color-coded tooling to prevent cross-contamination. Operationally, Commissary Specialists are required to maintain an uncompromised "clean-as-you-go" workflow, execute standard sanitization frequencies for all food-contact surfaces, and validate that all bulk reusable containers are thoroughly sanitized before crossing into the facility's designated "Clean Zone." Furthermore, they must demonstrate flawless compliance with personal hygiene mandates by executing the 20-second, six-step handwashing protocol at critical operational junctures, utilizing the mandatory restroom "Double Wash" method, and strictly adhering to the total restriction of unapproved jewelry and personal items within production boundaries.

3.5. Commissary Assistant

Shall be responsible for supporting day-to-day production workflows by rigorously executing foundational GMP standards and sanitation protocols across all preparation areas. They are required to maintain a continuous, real-time "clean-as-you-go" methodology to eliminate food debris and prevent the formation of biofilms on processing equipment. Operationally, they must ensure the thorough manual cleaning and chemical sanitization of tools, utensils, and reusable plastic containers prior to their reintroduction into active production zones. Commissary Assistants must strictly adhere to all personnel hygiene mandates, which includes performing the mandatory 20-second, six-step handwashing protocol, executing the specific restroom "Double Wash" method before returning to their workstations, properly sanitizing hands prior to donning gloves, and refraining from wearing any jewelry with the sole exception of a plain wedding band.

3.6. Back of House (BOH) and Front of House (FOH) Employees

Shall be responsible for rigorously executing the 20-second, six-step handwashing protocol at critical junctures, such as the beginning of shifts, after using the restroom (utilizing a specific "Double Wash" method), and after contacting the face, hair, refuse, or chemical agents. They must properly sanitize their hands before donning gloves, replace gloves immediately when soiled, and refrain from wearing any jewelry with the sole exception of a plain wedding band. Furthermore, they must maintain a continuous "clean-as-you-go" workflow to eliminate food debris, execute daily drain maintenance via scrubbing and chemical sanitization, and strictly follow specific restroom hygiene practices to prevent becoming a human vector for biological cross-contamination.

3.7. Shift Managers

Shall bear direct responsibility for the continuous, real-time enforcement of store-level operational process controls, ensuring that all food-contact surfaces are cleaned and sanitized at the mandatory minimum frequency of twice per shift. As the designated direct supervisors on duty, they are responsible for executing the practical phase of the bifurcated competency assessment by formally observing, verifying, and documenting technical tasks such as proper chemical dilutions and the 6-step handwashing method. Shift Managers must actively monitor active shifts to guarantee absolute compliance with the 20-second handwashing protocol, proper glove rotation, "clean-as-you-go" workflows, and the mandatory restroom "Double Wash" method. Furthermore, they shall oversee and validate the successful completion of daily sanitation tasks, including mechanical drain scrubbing and chemical sanitization, to effectively inhibit the aerosolization of environmental contaminants.

3.8. Restaurant Managers

Shall assume comprehensive operational accountability for their specific facility's overall compliance with the GMP policy and the broader Food Safety Management System (FSMS) framework. They are responsible for ensuring that the store's physical environment, drainage systems, ventilation, and hygiene facilities are continuously maintained in a secure, sanitary, and fully operational state. This includes guaranteeing strict comfort room compliance by ensuring the facility remains structurally isolated with properly functioning self-closing doors, and verifying it is continuously supplied with running potable water, liquid soap, single-use sanitary towels, and foot-pedal operated waste receptacles. Restaurant Managers shall coordinate directly with the Learning and Development (L&D) department to track competency frameworks, ensuring all restaurant employees complete foundational seminars and fulfill both theoretical and practical safety evaluations. Finally, they must review compliance data and QA audit results to implement immediate corrective actions that mitigate biological, chemical, and physical cross-contamination risks within the facility.

3.9. Operational Manager

Shall govern the macro-execution, strategic implementation, and enforcement of the GMP framework across all multi-unit store locations, ensuring it stands as a binding, universal mandate across their entire operational region. They shall partner directly with the Quality Assurance (QA) department to evaluate systemic audit trends, update operational protocols, and standardize structural environmental controls across the organization. Operational Manager is responsible for securing and allocating the necessary financial and material resources required by Restaurant Managers to maintain facility integrity, advanced air ventilation systems, and specialized hygiene equipment. Additionally, they shall serve as the primary operational liaison to Executive Leadership, providing data-driven feedback during the high-level review, governance, and formal policy approval processes.

3.10. Head Office Employees

Shall strictly adhere to the universal hygiene and conduct mandates of the GMP framework whenever visiting, auditing, or working within any spatial boundary of the operational facilities. To preserve the biological and physical integrity of controlled manufacturing environments, they must follow all standard employee protocols during site visits, which includes the total restriction of personal items, strong fragrances, artificial nails, and unapproved jewelry. Additionally, they shall assist in the high-level administrative alignment of corporate documentation and workforce

guidelines to ensure all employees' actions comply with overall company standards and regulatory protocols.

3.11. Human Resources (HR)

Shall be responsible for reviewing the personnel guidelines within the GMP policy to ensure they align with overall company standards and regulatory protocols. HR plays a vital role in governing workforce policy changes, such as standardizing the formal addressing of personnel from "staff members" to "employees" within official corporate documentation. They assist in establishing the structural expectations for employee conduct, personnel hygiene stations, changing areas, and comfort room regulations to ensure the facility maintains a compliant, secure, and legally sound working environment.

3.12. Learning and Development (L&D)

Shall be responsible for the structural deployment and oversight of the training framework that builds workforce competency. They ensure that core food safety principles are established through foundational seminars led by certified instructors. Furthermore, L&D oversees the bifurcated assessment process used to verify theoretical proficiency through digital or written examinations, and ensures a system is in place where direct supervisors formally observe, verify, and document practical, high-stakes technical tasks like chemical dilutions and proper handwashing.

3.13. Executive Leadership

The Executive team, consisting of the Vice President and the President, shall be responsible for the final review, high-level governance, and formal approval of the company's GMP policy. By officially signing off on this policy, they solidify the company’s corporate commitment to delivering safe, high-quality, and legally compliant services. They ensure that the policy stands as a binding, universal mandate that legally and operationally governs every individual, physical environment, and procedural lifecycle across all spatial boundaries of the organization.

4. Personnel Hygiene and Conduct

Strict employee hygiene is the primary defense against microbiological, chemical, and particulate contamination. All individuals, including contractual employees and contractors, must maintain exceptional personal cleanliness. This requires rigorous adherence to a mandatory 20-second handwashing protocol at critical junctures, such as the beginning of shifts, after handling wastes or chemicals, and following restroom use via a strict "Double Wash” method. Gloves are required for specific tasks but do not replace proper hand hygiene; personnel must wash their hands before donning them and replace them immediately if compromised. Furthermore, employees must utilize appropriate personal protective equipment (PPE)—such as sterile gowns, hairnets, and dedicated footwear—and are strictly obligated to report any infectious illnesses or open lesions so they can be temporarily excluded from direct contact with sensitive materials.

Equally critical to physical cleanliness is the strict regulation of employee conduct to preserve the integrity of controlled manufacturing environments. Operational policies strictly prohibit potential contamination sources; therefore, activities such as eating, drinking, smoking, chewing gum, and storing personal items are entirely restricted to designated non-production areas. To further prevent particulate shedding and chemical residues, employees are barred from wearing artificial nails, excessive makeup, strong fragrances, and jewelry, with the sole exception of a plain wedding band. Proper conduct also dictates that employees move deliberately and methodically within sterile zones to minimize air turbulence. Complete adherence to these behavioral and operational expectations is essential to safeguarding product quality, efficacy, and overall public health.

5. Facility Sanitation and Environmental Control

The structural and environmental integrity of a company and store's facility serves as the fundamental baseline for Good Manufacturing Practices (GMP), requiring a strategic location that effectively mitigates external risks such as pollution, flooding, and pest infestations. This foundational approach is reinforced by a facility design and construction that utilizes durable, food-safe materials and an optimized layout to facilitate seamless maintenance, effective drainage, and the absolute prevention of physical, chemical, and biological contamination. Within this controlled environment, all equipment, working surfaces, and reusable containers must be engineered for efficient disinfection, supported by specialized hygiene facilities for food and utensils that utilize a dedicated supply of potable water. To maintain atmospheric and personal standards, the infrastructure must incorporate advanced air ventilation systems to control aerosols and humidity, alongside comprehensive personnel hygiene stations that provide the necessary tools for rigorous hand sanitation and sanitary changing, thereby ensuring the facility's biological security remains uncompromised.

In the store's comfort room, it must be structurally isolated from all food preparation, storage, and service areas, utilizing solid, self-closing doors that do not open directly into the kitchen. These facilities must be maintained in a sanitary, well-lit condition and equipped with mechanical exhaust ventilation that directs air exclusively to the outside to prevent the ingress of airborne pathogens and odors into production zones. Furthermore, every comfort room must provide dedicated, fully operational handwashing stations supplied with continuous potable running water, liquid soap, single-use sanitary paper towels or air dryers, and foot-pedal operated, covered waste receptacles. To enforce stringent personnel hygiene, conspicuous signage mandating all employees to thoroughly wash their hands before returning to their workstations must be permanently displayed, ensuring that restroom use does not become a vector for biological cross-contamination.

6. Operational Process Controls

This necessitates a framework of continuous hygiene maintenance, whereby all food-contact surfaces are cleaned and sanitized at a minimum frequency of twice every shift to mitigate microbial accumulation. A "clean-as-you-go" methodology is strictly enforced to preemptively eliminate food debris and juices, thereby preventing the formation of resilient biofilms that harbor pathogens. This proactive approach is complemented by rigorous daily drain maintenance—comprising mechanical scrubbing and chemical sanitization—to inhibit the aerosolization of environmental contaminants such as *Listeria*. Additionally, all reusable plastic containers (RPCs) must be thoroughly sanitized prior to their reintroduction into the stores' "Clean Zone," ensuring that the integrity of the sanitary environment is preserved throughout the entirety of the production cycle.

7. Corrective Action

Level of Severity	Nature of Non - Conformance	Disciplinary Action
Minor	Internal process failures that may not directly impact product safety but affect overall efficiency and reputation	**1st Offense:** Incident Report (Written Reprimand) and establishing an official timeline re-training for improvement.

	(e.g Failed to document a routine, non-critical technical task observation on the daily shift checklist on time, despite the task being completed correctly. Or failed to clear away dry, non-allergenic food debris immediately, causing a temporary lapse in the required "clean-as-you-go" workflow, though no immediate cross-contamination risk is present.)	**2nd Offense:** A formal corrective action plan is issued by Quality Assurance (QA) **3rd Offense:** Final Warning letter will be given to the employee for continued non-compliance or Suspension without pay (1-2 days) when the employee did not comply after the final warning letter and to QA corrective action.
Major	Deviation from internal or contractual quality standards *(e.g. Employee failed to use the designated color-coded tooling or neglecting raw material traceability protocols during batch preparation.)*	**1st Offense:** Incident Report (Written Reprimand) and establishing an official timeline re-training for improvement. **2nd Offense:** A formal corrective action plan is issued by Quality Assurance (QA) **3rd Offense:** Final Warning letter will be given to the employee for continued non-compliance or Suspension without pay (2-3 days) when the employee did not comply after the final warning letter and to QA corrective action.
Critical	Failing to meet regulatory requirements, such as those outlined by the Food Safety Act of 2013 (RA 10611), and Code on Sanitation (PD No. 856) *(e.g. employee failed to report an open lesion or an active infectious illness to management, and continued to work directly with sensitive food materials.)*	**1st Offense:** Immediate Incident Report (Written Reprimand) and formal corrective action plan is issued by Quality Assurance (QA). **2nd Offense:** Final Warning, Suspension without pay (3-7 days) or leading directly to Termination

8. Training and Competency Verification

The training framework commences with foundational seminars led by certified instructors to establish core principles, yet recognizes that passive participation alone is insufficient to guarantee

operational mastery. Consequently, professional competency is verified through a rigorous, bifurcated assessment process designed to uphold the integrity of the Food Safety Management System (FSMS). Theoretical proficiency is initially validated via digital or written examinations that evaluate an individual's comprehension of critical safety thresholds and regulatory protocols, providing a necessary intellectual baseline. This is followed by a practical verification phase, during which a direct supervisor must formally observe and document the successful execution of high-stakes technical tasks, such as verifying proper chemical dilution or performing the validated 6-step handwashing method. By synthesizing objective testing with direct behavioral observation, the company ensures that every employee possesses the requisite knowledge and manual discipline necessary to maintain the highest standards of food safety and public health.

9. Change History

Revision No.:	Revision Date:	Author & Position:	Purpose of Revision
0	February 26, 2026	Marielle Louise Macabale**, QA/RND Specialist**	Originator
1	March 06, 2026	Marielle Louise Macabale**, QA/RND Specialist**	• Change the addressing of personnel; staff members to employees • Added a clause regarding store's comfort room under facility sanitation and environmental control • Added additional signatory; L&D Manager
2	May 25,2026	Celine Joy Sanchez**, QA Specialist**	• Added Responsibilities
3	June 22,2026	Celine Joy Sanchez**, QA Specialist**	• Added Responsibilities for WHS Employee/Manager, Commissary Specialist/Assistants Shift/Restaurant and Operational Managers
4	June 25,2026	Celine Joy Sanchez**, QA Specialist**	• Added Corrective Action
